

Home Networking

Adding harmony™ to home design

harmony™
home network systems

What is harmony™?

harmony™ is a structured wiring system, developed by HPM, to manage and distribute existing and future technologies around the home. harmony™ complements existing automation systems and requires no programming or software.

harmony™ enables:

Whole-house audio and video

Audio, video, television (including pay and free-to-air TV) and DVD* can be distributed to a number of rooms throughout the home.

Whole-house infrared control

harmony™ infrared system provides flexibility to control technologies such as televisions and stereos remotely, even if the technology is located in another room.

Integrated security functions

harmony™ supports security functions including alarm systems and devices such as security cameras*.

Whole-house office networking

harmony™ can network computers to enable shared access to technologies such as scanners, printers and high speed Internet access.

Whole-house phone distribution

harmony™ allows for several different telephone lines for simultaneous incoming and outgoing calls.

harmony™ can be tailored to meet individual requirements of your next project. The system can be upgraded and customised at any time with additional modules.

** The audio visual signal from DVD players and security cameras must be converted to a radio frequency signal via a modulator.*
